dbConnect,OdbcDriver-method

Connect to a ODBC compatible database

Description

Connect to a ODBC compatible database

Usage

```
## S4 method for signature 'OdbcDriver'
dbConnect(
  drv,
  dsn = NULL,
  ...,
  timezone = "UTC",
  timezone_out = "UTC",
  encoding = "",
  bigint = c("integer64", "integer", "numeric", "character"),
  timeout = 10,
  driver = NULL,
  server = NULL,
  database = NULL,
  uid = NULL,
  pwd = NULL,
  dbms.name = NULL,
  .connection_string = NULL
)
```

Arguments

drv	an object that inherits from DBIDriver, or an existing DBIConnection object (in order to clone an existing connection).
dsn	The Data Source Name.
• • •	Additional ODBC keywords, these will be joined with the other arguments to form the final connection string.
timezone	The Server time zone. Useful if the database has an internal timezone that is <i>not</i> 'UTC'. If the database is in your local timezone set to Sys.timezone(). See

OlsonNames() for a complete list of available timezones on your system.

timezone_out The time zone returned to R. Useful if you want the timezone returned to R is

not 'UTC'.

encoding The text encoding used on the Database. If the database is not using UTF-8 you

will need to set the encoding to get accurate re-encoding. See iconvlist() for a complete list of available encodings on your system. Note strings are always

returned UTF-8 encoded.

bigint The R type that SQL_BIGINT types should be mapped to, default is bit64::integer64,

which allows the full range of 64 bit integers.

timeout Time in seconds to timeout the connection attempt. Setting a timeout of Inf

indicates no timeout. (defaults to 10 seconds).

driver The ODBC driver name.
server The server hostname.
database The database on the server.

uid The user identifier.
pwd The password to use.

dbms.name The database management system name. This should normally be queried au-

tomatically by the ODBC driver. This name is used as the class name for the OdbcConnect object returned from dbConnect(). However if the driver does

not return a valid value it can be set manually with this parameter.

.connection_string

A complete connection string, useful if you are copy pasting it from another source. If this argument is used any additional arguments will be appended to this string.

Details

The connection string keywords are driver dependent. The parameters documented here are common, but some drivers may not accept them. Please see the specific driver documentation for allowed parameters, https://www.connectionstrings.com is also a useful resource of example connection strings for a variety of databases.

dbListFields,OdbcConnection,character-method

List field names of a remote table

Description

List field names of a remote table

```
## S4 method for signature 'OdbcConnection, character'
dbListFields(
   conn,
   name,
   catalog_name = NULL,
   schema_name = NULL,
   column_name = NULL,
   ...
)
```

Arguments

conn	A DBIConnection object, as returned by dbConnect().
name	a character string with the name of the remote table.
catalog_name	The name of the catalog to return, the default returns all catalogs.
schema_name	The name of the schema to return, the default returns all schemas.
column_name	The name of the column to return, the default returns all columns.
	Other parameters passed on to methods.

Details

% can be used as a wildcard in any of the search parameters to match 0 or more characters. _ can be used to match any single character.

Value

dbListFields() returns a character vector that enumerates all fields in the table in the correct order. This also works for temporary tables if supported by the database. The returned names are suitable for quoting with dbQuoteIdentifier(). If the table does not exist, an error is raised. Invalid types for the name argument (e.g., character of length not equal to one, or numeric) lead to an error. An error is also raised when calling this method for a closed or invalid connection.

Specification

The name argument can be

- · a string
- the return value of dbQuoteIdentifier()
- a value from the table column from the return value of dbListObjects() where is_prefix is FALSE

A column named row_names is treated like any other column.

See Also

```
dbColumnInfo() to get the type of the fields.
```

```
Other DBIConnection generics: DBIConnection-class, dbAppendTable(), dbCreateTable(), dbDataType(), dbDisconnect(), dbExecute(), dbExistsTable(), dbGetException(), dbGetInfo(), dbGetQuery(), dbIsReadOnly(), dbIsValid(), dbListObjects(), dbListResults(), dbListTables(), dbReadTable(), dbRemoveTable(), dbSendQuery(), dbSendStatement(), dbWriteTable()
```

Examples

```
con <- dbConnect(RSQLite::SQLite(), ":memory:")
dbWriteTable(con, "mtcars", mtcars)
dbListFields(con, "mtcars")
dbDisconnect(con)</pre>
```

```
dbListTables,OdbcConnection-method

List remote tables
```

Description

Returns the unquoted names of remote tables accessible through this connection. This should include views and temporary objects, but not all database backends (in particular **RMariaDB** and **RMySQL**) support this.

Usage

```
## S4 method for signature 'OdbcConnection'
dbListTables(
  conn,
  catalog_name = NULL,
  schema_name = NULL,
  table_name = NULL,
  table_type = NULL,
  ...
)
```

Arguments

```
conn A DBIConnection object, as returned by dbConnect().

catalog_name The name of the catalog to return, the default returns all catalogs.

schema_name The name of the schema to return, the default returns all schemas.

table_name The name of the table to return, the default returns all tables.

table_type The type of the table to return, the default returns all table types.

Other parameters passed on to methods.
```

Details

% can be used as a wildcard in any of the search parameters to match 0 or more characters. _ can be used to match any single character.

Value

dbListTables() returns a character vector that enumerates all tables and views in the database. Tables added with dbWriteTable() are part of the list, including temporary tables if supported by the database. As soon a table is removed from the database, it is also removed from the list of database tables.

The returned names are suitable for quoting with dbQuoteIdentifier(). An error is raised when calling this method for a closed or invalid connection.

See Also

The ODBC documentation on Pattern Value Arguments for further details on the supported syntax.

odbc 7

Examples

```
con <- dbConnect(RSQLite::SQLite(), ":memory:")
dbListTables(con)
dbWriteTable(con, "mtcars", mtcars)
dbListTables(con)
dbDisconnect(con)</pre>
```

odbc

Odbc driver

Description

Driver for an ODBC database.

Usage

odbc()

Examples

```
## Not run:
#' library(DBI)
odbc::odbc()
## End(Not run)
```

odbc-tables

Convenience functions for reading/writing DBMS tables

Description

Convenience functions for reading/writing DBMS tables

```
## S4 method for signature 'OdbcConnection,character,data.frame'
dbWriteTable(
   conn,
   name,
   value,
   overwrite = FALSE,
   append = FALSE,
   temporary = FALSE,
   row.names = NA,
   field.types = NULL,
   batch_rows = getOption("odbc.batch_rows", 1024),
   ...
)
```

8 odbc-tables

```
## S4 method for signature 'OdbcConnection, Id, data.frame'
dbWriteTable(
  conn,
  name,
  value,
  overwrite = FALSE,
  append = FALSE,
  temporary = FALSE,
  row.names = NA,
  field.types = NULL,
  batch_rows = getOption("odbc.batch_rows", 1024),
)
## S4 method for signature 'OdbcConnection, SQL, data.frame'
dbWriteTable(
  conn,
  name,
  value,
  overwrite = FALSE,
  append = FALSE,
  temporary = FALSE,
  row.names = NA,
  field.types = NULL,
  batch_rows = getOption("odbc.batch_rows", 1024),
)
## S4 method for signature 'OdbcConnection'
sqlData(con, value, row.names = NA, ...)
## S4 method for signature 'OdbcConnection'
sqlCreateTable(
  con,
  table,
  fields,
  field.types = NULL,
  row.names = NA,
  temporary = FALSE,
)
```

Arguments

conn

a OdbcConnection object, produced by DBI::dbConnect() a character string specifying a table name. Names will be automatically quoted name so you can use any sequence of characters, not just any valid bare table name. value A data.frame to write to the database. overwrite

Allow overwriting the destination table. Cannot be TRUE if append is also TRUE. Allow appending to the destination table. Cannot be TRUE if overwrite is also append

TRUE.

OdbcConnection 9

temporary If TRUE, will generate a temporary table statement.

row.names Either TRUE, FALSE, NA or a string.

If TRUE, always translate row names to a column called "row_names". If FALSE, never translate row names. If NA, translate rownames only if they're a character

vector.

A string is equivalent to TRUE, but allows you to override the default name.

For backward compatibility, NULL is equivalent to FALSE.

field. types Additional field types used to override derived types.

batch_rows The number of row of the batch when writing, depending on the database, driver

and dataset adjusting this lower or higher may improve performance.

. . . Other arguments used by individual methods.

con A database connection.

table Name of the table. Escaped with dbQuoteIdentifier().

fields Either a character vector or a data frame.

A named character vector: Names are column names, values are types. Names

are escaped with dbQuoteIdentifier(). Field types are unescaped.

A data frame: field types are generated using dbDataType().

Examples

```
## Not run:
library(DBI)
con <- dbConnect(odbc::odbc())
dbListTables(con)
dbWriteTable(con, "mtcars", mtcars, temporary = TRUE)
dbReadTable(con, "mtcars")

dbListTables(con)
dbExistsTable(con, "mtcars")

# A zero row data frame just creates a table definition.
dbWriteTable(con, "mtcars2", mtcars[0, ], temporary = TRUE)
dbReadTable(con, "mtcars2")

dbDisconnect(con)

## End(Not run)</pre>
```

 ${\tt OdbcConnection}$

Odbc Connection Methods

Description

Implementations of pure virtual functions defined in the DBI package for OdbcConnection objects.

10 OdbcConnection

```
## S4 method for signature 'OdbcConnection'
show(object)
## S4 method for signature 'OdbcConnection'
dbIsValid(db0bj, ...)
## S4 method for signature 'OdbcConnection'
dbDisconnect(conn, ...)
## S4 method for signature 'OdbcConnection, character'
dbSendQuery(conn, statement, params = NULL, ..., immediate = FALSE)
## S4 method for signature 'OdbcConnection, character'
dbSendStatement(conn, statement, params = NULL, ..., immediate = FALSE)
## S4 method for signature 'OdbcConnection, ANY'
dbDataType(dbObj, obj, ...)
## S4 method for signature 'OdbcConnection,data.frame'
dbDataType(dbObj, obj, ...)
## S4 method for signature 'OdbcConnection, character'
dbQuoteIdentifier(conn, x, ...)
## S4 method for signature 'OdbcConnection, SQL'
dbQuoteIdentifier(conn, x, ...)
## S4 method for signature 'OdbcConnection, character'
dbExistsTable(conn, name, ...)
## S4 method for signature 'OdbcConnection, character'
dbRemoveTable(conn, name, ...)
## S4 method for signature 'OdbcConnection'
dbGetInfo(db0bj, ...)
## S4 method for signature 'OdbcConnection, character'
dbGetQuery(conn, statement, n = -1, params = NULL, ...)
## S4 method for signature 'OdbcConnection'
dbBegin(conn, ...)
## S4 method for signature 'OdbcConnection'
dbCommit(conn, ...)
## S4 method for signature 'OdbcConnection'
dbRollback(conn, ...)
## S4 method for signature 'OdbcConnection,Id'
dbExistsTable(conn, name, ...)
```

odbcConnectionActions 11

```
## S4 method for signature 'OdbcConnection,SQL'
dbExistsTable(conn, name, ...)
```

Arguments

object Any R object

db0bj An object inheriting from DBIObject, i.e. DBIDriver, DBIConnection, or a

DBIResult

... Other arguments to methods.

conn A DBIConnection object, as returned by dbConnect().

statement a character string containing SQL.

params Query parameters to pass to dbBind(), See dbBind() for details.

immediate If TRUE, SQLExecDirect will be used instead of SQLPrepare, and the params

argument is ignored

obj An R object whose SQL type we want to determine.

x A character vector, SQL or Id object to quote as identifier.

name A character string specifying a DBMS table name.

maximum number of records to retrieve per fetch. Use n = -1 or n = Inf to

retrieve all pending records. Some implementations may recognize other special

values.

odbcConnectionActions List the actions supported for the connection

Description

Return a list of actions that can be performed on the connection.

Usage

odbcConnectionActions(connection)

Arguments

connection A connection object, as returned by dbConnect().

Details

The list returned is a named list of actions, where each action has the following properties:

callback A function to be invoked to perform the action **icon** An optional path to an icon representing the action

Value

A named list of actions that can be performed on the connection.

12 odbcConnectionColumns

 $odbc {\tt Connection Columns} \quad odbc {\tt Connection Columns}$

Description

For a given table this function returns detailed information on all fields / columns. The expectation is that this is a relatively thin wrapper around the ODBC SQLColumns function call, with some of the field names renamed / re-ordered according to the return specifications below.

Usage

```
odbcConnectionColumns(conn, name, ...)
## S4 method for signature 'OdbcConnection,Id'
odbcConnectionColumns(conn, name, column_name = NULL)
## S4 method for signature 'OdbcConnection,character'
odbcConnectionColumns(
    conn,
    name,
    catalog_name = NULL,
    schema_name = NULL,
    column_name = NULL
)
```

Arguments

conn	OdbcConnection
name	table we wish to get information on
•••	additional parameters to methods
column_name	The name of the column to return, the default returns all columns.
catalog_name	charaacter catalog where the table is located
schema_name	charaacter schema where the table is located

Details

In dbWriteTable() we make a call to this method to get details on the fields of the table we are writing to. In particular the columns data_type, column_size, and decimal_digits are used. An implementation is not necessary for dbWriteTable() to work.

Value

data.frame with columns

- name
- field.type equivalent to type_name in SQLColumns output
- table_name
- · schema_name
- catalog_name

odbcConnectionIcon 13

- data_type
- column_size
- buffer_length
- decimal_digits
- numeric_precision_radix
- column_default
- sql_data_type
- sql_datetime_subtype
- char_octet_length
- ordinal_position
- nullable

See Also

The ODBC documentation on SQLColumns for further details.

 $odbc {\tt Connection Icon}$

Get an icon representing a connection.

Description

Return the path on disk to an icon representing a connection.

Usage

```
odbcConnectionIcon(connection)
```

Arguments

connection

A connection object, as returned by dbConnect().

Details

The icon returned should be a 32x32 square image file.

Value

The path to an icon file on disk.

14 odbcDataType

 $odbc \\ Data \\ Type$

Return the corresponding ODBC data type for an R object

Description

This is used when creating a new table with dbWriteTable(). Databases with default methods defined are

- MySQL
- PostgreSQL
- SQL Server
- Oracle
- SQLite
- Spark
- Hive
- Impala
- Redshift
- Vertica
- BigQuery
- Teradata
- Access

Usage

```
odbcDataType(con, obj, ...)
```

Arguments

con A driver connection object, as returned by dbConnect().

obj An R object.

... Additional arguments passed to methods.

Details

If you are using a different database and dbWriteTable() fails with a SQL parsing error the default method is not appropriate, you will need to write a new method.

Value

Corresponding SQL type for the obj.

OdbcDriver 15

Defining a new dbDataType method

The object type for your connection will be the database name retrieved by dbGetInfo(con)\$dbms.name. Use the documentation provided with your database to determine appropriate values for each R data type. An example method definition of a fictional foo database follows.

```
con <- dbConnect(odbc::odbc(), "FooConnection")</pre>
dbGetInfo(con)$dbms.name
#> [1] "foo"
`odbcDataType.foo <- function(con, obj, ...) {</pre>
  switch_type(obj,
    factor = "VARCHAR(255)",
    datetime = "TIMESTAMP",
    date = "DATE",
    binary = "BINARY"
    integer = "INTEGER",
    double = "DOUBLE",
    character = "VARCHAR(255)",
    logical = "BIT",
    list = "VARCHAR(255)",
    stop("Unsupported type", call. = FALSE)
}
```

OdbcDriver

Odbc Driver Methods

Description

Implementations of pure virtual functions defined in the DBI package for OdbcDriver objects.

```
## S4 method for signature 'OdbcDriver'
show(object)

## S4 method for signature 'OdbcDriver,ANY'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'OdbcDriver,list'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'OdbcDriver,data.frame'
dbDataType(dbObj, obj, ...)

## S4 method for signature 'OdbcDriver'
dbIsValid(dbObj, ...)

## S4 method for signature 'OdbcDriver'
dbGetInfo(dbObj, ...)
```

16 odbcListDataSources

Arguments

object	Any R object
db0bj	A object inheriting from DBIDriver or DBIConnection
obj	An R object whose SQL type we want to determine.
	Other arguments passed on to methods.

Description

Lists the names and types of each column (field) of a specified object.

Usage

```
odbcListColumns(connection, ...)
```

Arguments

connection A connection object, as returned by dbConnect().
... Parameters specifying the object.

Details

The object to inspect must be specified as one of the arguments (e.g. table = "employees"); depending on the driver and underlying data store, additional specification arguments may be required.

Value

A data frame with name and type columns, listing the object's fields.

odbcListDataSources List Available Data Source Names

Description

List the available data sources on your system. See the DSN Configuration files section of the package README for details on how to install data sources for the most common databases.

Usage

```
odbcListDataSources()
```

Value

A data frame with two columns.

name Name of the data source

description Data Source description

odbcListDrivers 17

adhal	istDrivers	

List Available ODBC Drivers

Description

List the available drivers on your system. See the Installation section of the package README for details on how to install drivers for the most common databases.

Usage

```
odbcListDrivers(
  keep = getOption("odbc.drivers_keep"),
  filter = getOption("odbc.drivers_filter")
)
```

Arguments

keep A character vector of driver names to keep in the results, if NULL (the default)

will keep all drivers.

filter A character vector of driver names to filter from the results, if NULL (the default)

will not filter any drivers.

Value

A data frame with three columns. If a given driver does not have any attributes the last two columns will be NA. Drivers can be excluded from being returned by setting the odbc.drivers.filter option.

name Name of the driverattribute Driver attribute namevalue Driver attribute value

odbcListObjects

List objects in a connection.

Description

Lists all of the objects in the connection, or all the objects which have specific attributes.

Usage

```
odbcListObjects(connection, \ldots)
```

Arguments

```
connection A connection object, as returned by dbConnect().
```

... Attributes to filter by.

Details

When used without parameters, this function returns all of the objects known by the connection. Any parameters passed will filter the list to only objects which have the given attributes; for instance, passing schema = "foo" will return only objects matching the schema foo.

Value

A data frame with name and type columns, listing the objects.

odbcListObjectTypes

Return the object hierarchy supported by a connection.

Description

Lists the object types and metadata known by the connection, and how those object types relate to each other.

Usage

```
odbcListObjectTypes(connection)
```

Arguments

connection

A connection object, as returned by dbConnect().

Details

The returned hierarchy takes the form of a nested list, in which each object type supported by the connection is a named list with the following attributes:

contains A list of other object types contained by the object, or "data" if the object contains data **icon** An optional path to an icon representing the type

For instance, a connection in which the top-level object is a schema that contains tables and views, the function will return a list like the following:

Value

The hierarchy of object types supported by the connection.

odbcPreviewObject 19

odbcPreviewObject

Preview the data in an object.

Description

Return the data inside an object as a data frame.

Usage

```
odbcPreviewObject(connection, rowLimit, ...)
```

Arguments

connection A connection object, as returned by dbConnect().

rowLimit The maximum number of rows to display.

... Parameters specifying the object.

Details

The object to previewed must be specified as one of the arguments (e.g. table = "employees"); depending on the driver and underlying data store, additional specification arguments may be required.

Value

A data frame containing the data in the object.

OdbcResult

Odbc Result Methods

Description

Implementations of pure virtual functions defined in the DBI package for OdbcResult objects.

```
## S4 method for signature 'OdbcResult'
dbClearResult(res, ...)

## S4 method for signature 'OdbcResult'
dbFetch(res, n = -1, ...)

## S4 method for signature 'OdbcResult'
dbHasCompleted(res, ...)

## S4 method for signature 'OdbcResult'
dbIsValid(dbObj, ...)

## S4 method for signature 'OdbcResult'
```

```
dbGetStatement(res, ...)
## S4 method for signature 'OdbcResult'
dbColumnInfo(res, ...)
## S4 method for signature 'OdbcResult'
dbGetRowCount(res, ...)
## S4 method for signature 'OdbcResult'
dbGetRowsAffected(res, ...)
## S4 method for signature 'OdbcResult'
dbBind(res, params, ..., batch_rows = getOption("odbc.batch_rows", 1024))
```

Arguments

res	An object inheriting from DBIResult.
	Other arguments passed on to methods.
n	maximum number of records to retrieve per fetch. Use $n = -1$ or $n = Inf$ to retrieve all pending records. Some implementations may recognize other special values.
db0bj	An object inheriting from DBIObject, i.e. DBIDriver, DBIConnection, or a DBIResult
params	A list of bindings, named or unnamed.
batch_rows	The number of row of the batch when writing, depending on the database, driver and dataset adjusting this lower or higher may improve performance.

odbc Set Transaction I so lation Level

Set the Transaction Isolation Level for a Connection

Description

Set the Transaction Isolation Level for a Connection

Usage

```
odbcSetTransactionIsolationLevel(conn, levels)
```

Arguments

conn A DBIConnection object, as returned by dbConnect().

levels One or more of 'read_uncommitted', 'read_committed', 'repeatable_read', 'se-

rializable'.

See Also

https://docs.microsoft.com/en-us/sql/odbc/reference/develop-app/setting-the-transaction-isolati

test_roundtrip 21

Examples

```
## Not run:
    # Can use spaces or underscores in between words.
    odbcSetTransactionIsolationLevel(con, "read uncommitted")

# Can also use the full constant name.
    odbcSetTransactionIsolationLevel(con, "SQL_TXN_READ_UNCOMMITTED")

## End(Not run)
```

test_roundtrip

Test round tripping a simple table

Description

This tests all the supported data types, including missing values. It first writes them to the database, then reads them back and verifies the data is identical to the original.

Usage

```
test_roundtrip(
  con = DBItest:::connect(DBItest:::get_default_context()),
  columns = "",
  invert = TRUE,
  force_sorted = FALSE
)
```

Arguments

con An established DBI connection.

columns Table columns to exclude (default) or include, dependent on the value of invert.

One of datetime, date, binary, integer, double, character, logical.

invert If TRUE, change the definition of columns to be exclusive, rather than inclusive.

force_sorted If TRUE, a sorted id column is added to the sent data, and the received data is

sorted by this column before doing the comparison. This is necessary for some

databases that do not preserve row order.

Details

This function is not exported and should only be used during tests and as a sanity check when writing new odbcDataType() methods.

Examples

```
## Not run:
test_roundtrip(con)

# exclude a few columns
test_roundtrip(con, c("integer", "double"))
# Only test a specific column
```

22 test_roundtrip

```
test_roundtrip(con, "integer", invert = FALSE)
## End(Not run)
```

Index

```
